

# Inspiring Excellence

Course Title: Programming Language II
Course Code: CSE 111

Lab Assignment no: 5

Write a class called **Marks** with a required constructor. Then perform the addition using operator overloading

# #Write your code here

# #Do not change the following lines of code

Q1 = Marks(int(input("Quiz 1 (out of 10): ")))

Q2 = Marks(int(input("Quiz 2 (out of 10): ")))

Lab = Marks(int(input("Lab (out of 30): ")))

Mid = Marks(int(input("Mid (out of 20): ")))

Final = Marks(int(input("Final (out of 30): ")))

total = Q1 + Q2 + Lab + Mid + Final

print("Total marks: {}".format(total.mark))

# **Sample Input 1:**

Quiz 1 (out of 10): 10

Quiz 2 (out of 10): 10

Lab (out of 30): 30

Mid (out of 20): 20

Final (out of 30): 30

### **Sample Output 1:**

Total marks: 100

## **Sample Input 2:**

Quiz 1 (out of 10): 10

Quiz 2 (out of 10): 8

Lab (out of 30): 30

Mid (out of 20): 20

Final (out of 30): 29

### **Sample Output 2:**

Total marks: 97

Design the program to get the output as shown.

### Subtasks:

- 1. You will need to create 2 classes: Teacher and Course
- 2. Make all the variables in the Teacher class **private**.
- 3. Make all the variables in the Course class public.
- 4. Write the required codes in the Teacher and Course classes.

# [You are not allowed to change the code below]

# Write your code here for subtasks 1-4	Output:	
t1 = Teacher("Saad Abdullah", "CSE") t2 = Teacher("Mumit Khan", "CSE") t3 = Teacher("Sadia Kazi", "CSE") c1 = Course("CSE 110 Programming Language I") c2 = Course("CSE 111 Programming Language-II") c3 = Course("CSE 220 Data Structures") c4 = Course("CSE 221 Algorithms") c5 = Course("CSE 230 Discrete Mathematics") c6 = Course("CSE 310 Object Oriented Programming") c7 = Course("CSE 320 Data Communications") c8 = Course("CSE 340 Computer Architecture") t1.addCourse(c1) t1.addCourse(c2) t2.addCourse(c3) t2.addCourse(c4) t2.addCourse(c5) t3.addCourse(c6) t3.addCourse(c8) t1.printDetail() t2.printDetail() t3.printDetail()	Name: Saad Abdullah Department: CSE List of courses	
	CSE 110 Programming Language I CSE 111 Programming Language-II	
	Name: Mumit Khan Department: CSE List of courses	
	CSE 220 Data Structures CSE 221 Algorithms CCSE 230 Discrete Mathematics	
	Name: Sadia Kazi Department: CSE List of courses	
	CSE 310 Object Oriented Programming CSE 320 Data Communications CSE 340 Computer Architecture	

Design the program to get the output as shown.

#### Subtasks:

- 1. You will need to create 2 classes: **Team** and **Player**
- Make all the variables in the Team class private.
- 3. Make all the variables in the Player class **public**.
- 4. Write the required codes in the Team and Player classes

### Hints:

- Create a list in team class to store the player's name in that list
- Use constructor overloading technique for Team class

# [You are not allowed to change the code below]

#### # Write your code here for subtasks 1-4 Output: b = Team()Team: Bangladesh b.setName('Bangladesh') List of Players: mashrafi = Player("Mashrafi") ['Mashrafi', 'Tamim'] b.addPlayer(mashrafi) \_\_\_\_\_ tamim = Player("Tamim") b.addPlayer(tamim) Team: Australia b.printDetail() List of Players: a = Team("Australia") ['Ponting', 'Lee'] ponting = Player("Ponting") a.addPlayer(ponting) lee = Player("Lee") a.addPlayer(lee) a.printDetail()

Look at the code and the sample inputs and outputs below to design the program accordingly.

- 1. Write a class called **Color** that only adds the 3 primary colors (red, blue and yellow).
- 2. Write a required constructor for the class.
- 3. You have to use operator overloading to get the desired outputs as shown.

#### Hint:

There will be only one constructor and only one method tackling the addition operation. No other methods are required.

Note: Order of the color given as input should not matter. For example, in sample input 1, if the first input was yellow and then red, the output would still be orange.

### #Write your code here

# #Do not change the following lines of code

C1 = Color(input("First Color: ").lower())
C2 = Color(input("Second Color: ").lower())

C3 = C1 + C2

print("Color formed:", C3.clr)

# Sample Input 1:

First Color: red

Second Color: yellow

#### **Sample Output 1:**

Color formed: Orange

### Sample Input 2:

First Color: red Second Color: blue

## Sample Output 2:

Color formed: Violet

#### Sample Input 3:

First Color: yellow Second Color: BLUE

## Sample Output 3:

Color formed: Green

Write a class called Circle with the required constructor and methods to get the following output.

#### Subtasks:

- 1. Create a class called Circle.
- 2. Create the required **constructor**. Use **Encapsulation** to protect the variables. [**Hint**: Assign the variables in **private**]
- 3. Create **getRadius()** and **setRadius()** method to access variables.
- 4. Create a **method** called area to calculate the area of circles.
- 5. Handle the **operator overloading** by using a **special method** to calculate the radius and area of circle 3.

## [You are not allowed to change the code below]

# # Write your code here for subtasks 1-5

c1 = Circle(4)

print("First circle radius:" , c1.getRadius())

c2 = Circle(5)

print("Second circle radius:" ,c2.getRadius())

print("Second circle area:" ,c2.area())

print("First circle area:" ,c1.area())

c3 = c1 + c2

print("Third circle radius:" ,c3.getRadius())

print("Third circle area:" ,c3.area())

## **Output:**

First circle radius: 4

First circle area: 50.26548245743669

Second circle radius: 5 Second circle area: 78.53981633974483 Third circle radius: 9 Third circle area: 254.46900494077323

Write a class called Triangle with the required constructor and methods to get the following output.

#### Subtasks:

- 1. Create a **class** called Triangle.
- 2. Create the required **constructor**. Use **Encapsulation** to protect the variables. [**Hint**: Assign the variables in **private**]
- Create getBase(), getHeight(), setBase and setHeight() method to access variables.
- 4. Create a **method** called area to calculate the area of triangles.
- 5. Handle the **operator overloading** by using a **special method** to calculate the radius and area of triangle 3.

## [You are not allowed to change the code below]

# # Write your code here for subtasks 1-5

t1 = Triangle(10, 5)
print("First Triangle Base:", t1.getBase())
print("First Triangle Height:", t1.getHeight())
print("First Triangle area:",t1.area())

t2 = Triangle(5, 3)
print("Second Triangle Base:", t2.getBase())
print("Second Triangle Height:", t2.getHeight())
print("Second Triangle area:",t2.area())

t3 = t1 - t2 print("Third Triangle Base:", t3.getBase()) print("Third Triangle Height:", t3.getHeight()) print("Third Triangle area:",t3.area())

# **Output:**

First Triangle Base: 10 First Triangle Height: 5 First Triangle area: 25.0 Second Triangle Base: 5 Second Triangle Height: 3 Second Triangle area: 7.5 Third Triangle Base: 5 Third Triangle Height: 2 Third Triangle area: 5.0

Observe the given code carefully. Try to understand from the given code and the outputs what to write in your class **Dolls**.

```
Output:
# Write your code here
                                                        Doll: Tweety
                                                        Total Price: 2500 taka
obj_1 = Dolls("Tweety", 2500)
print(obj_1.detail())
                                                        Thank you!
if obj_1 > obj_1:
  print("Congratulations! You get the Tweety as a gift!")
                                                        Doll: Daffy Duck
                                                        Total Price: 1800 taka
else:
  print("Thank you!")
                                                        Thank you!
print("======"")
                                                        Doll: Bugs Bunny
obj 2 = Dolls("Daffy Duck", 1800)
                                                        Total Price: 3000 taka
print(obj_2.detail())
                                                        Congratulations! You get the Tweety as a gift!
if obj 2 > obj 1:
  print("Congratulations! You get the Tweety as a gift!")
                                                        Doll: Porky Pig
                                                        Total Price: 1500 taka
else:
  print("Thank you!")
                                                        Thank you!

  print("Congratulations! You get the Tweety as a gift!")
else:
  print("Thank you!")
print("======"")
obj_5 = obj_2 + obj_3
print(obj_5.detail())
if obj_5 > obj_1:
  print("Congratulations! You get the Tweety as a gift!")
  print("Thank you!")
```

## [You are not allowed to change the code above]

#### Subtasks:

- 1. Create a Doll class.
- 2. Create the required constructor.
- 3. Write a method to print the name and the price of the object
- 4. Use operator overloading for the addition operators.
- 5. Write a method to handle operator overloading for the ">" logical operator that compares the price of the objects.

#### Hints:

- Notice that the price of each object is being checked with the price of obj in the given code.
- Notice the word Doll in the first 4 outputs and the last output. You have to print exactly as represented here.

# Task 8

Design a class called **Coordinates** with an appropriate constructor. Then perform the subtraction, multiplication and equality check operations in the given code using operator overloading.

#Write your code here	Sample Input 1:
#Do not change the following lines of code	1 2
3	3
p1 = Coordinates(int(input()),int(input()))	4
p2 = Coordinates(int(input()),int(input()))	Sample Output 1:
	(-2,-2)
p4 = p1 - p2	(3,8)
print(p4.detail())	The calculated coordinates are NOT the same.
	Sample Input 2:
p5 = p1 * p2	0
print(p5.detail())	0
	0
point_check = (p4 == p5)	0
print(point_check)	Sample Output 2:
	(0,0)
	(0,0)
	The calculated coordinates are the same.

```
class Test:
    def init (self):
        self.sum = 0
        self.y = 0
    def methodA(self):
        x=0
        y = 0
       y = y + 7
       x = y + 11
        self.sum = x + y
       print(x , y, self.sum)
    def methodB(self):
        x = 0
        self.y = self.y + 11
        x = x + 33 + self.y
        self.sum = self.sum + x + self.y
        print(x , self.y, self.sum)
